About Your Company

Gemu is a voxel game engine dedicated to mainstreaming voxel technology as a viable medium for modern game development and digital entertainment. By providing robust, creator-focused tools and eliminating historic technical friction, Gemu empowers developers to build and innovate in a fresh, untapped space.

Gemu provides an end-to-end, out-of-the-box game engine featuring:

- **Advanced Render & Audio Tech:** Native ray-traced lighting and ray-traced audio.
- **Core Systems:** Built-in multiplayer capabilities and advanced physics.
- **Developer Integration:** Native Model Context Protocol (MCP) support and seamless Steam backend integration.

We are currently in an exclusive Early Access phase, actively collaborating with select game development studios. We are continuously expanding our partnerships to onboard more studios, creators, and technical partners to co-create and test engine features.

- **Infrastructure:** Out-of-the-box multiplayer, physics, and Steam integration remove months of standard backend setup.
- **Modern Tech Stack:** Combining ray-traced graphics/audio with native MCP support gives developers next-generation fidelity and workflows.
- **Frictionless Voxel Development:** We overcome traditional voxel performance and tooling bottlenecks, making the medium fully accessible for commercial-grade modern games.

FUTURE GAMES

Business Challenge

Gemu Ecosystem Expansion:
Developer Funnel, Community Forum, Bootcamp, Publishing & Investor Portal

Gemu is evolving beyond engine development—we are a full-fledged ecosystem that publishes games, runs the Gemu Bootcamp, and incubates internal/external studios. We are now transitioning from a closed Early Access phase to an application-based request-access model for developers, studios, and publishing partners.

Core Strategic Goals:

1. **Studio & Publishing Funnel:** Design a "Request Access / Submit Game" application journey that filters both engine users and games seeking publishing deals.
2. **Discord-Linked Forum:** Build a searchable technical Q&A forum seamlessly connected to our Discord community so developers get fast support without community fragmentation.
3. **Gemu Bootcamp Activation:** Use our web platform to spark interest and drive conversions for our Gemu Bootcamp program.
4. **UGC Voxel Asset Store:** Launch an integrated, engine-connected marketplace where creators can buy, sell, and share custom voxel models and tools—monetizing creator contributions and accelerating prototype production.

Key Questions for Teams:

- How should our website architecture guide 3 distinct user groups simultaneously: **developers** (engine access & forum), **creators/learners** (Bootcamp & publishing), and **investors** (licensing & studio investment)?
- What is the ideal community workflow for bridging real-time Discord chat with a structured, indexable developer Q&A forum?
- How can we position Gemu's dual role as both an advanced voxel engine AND a game publisher to maximize studio sign-ups?

Target Audience

Current Primary Audience

Our primary target audience today consists of indie game studios, new developers, students, and industry veterans launching independent studios (including former AAA/mid-tier devs creating their own ventures). These creators are eager to build in an untapped space volumetric pixels (voxels) which is historically complex and frustrating to implement in traditional engines. Letting developers focus 100% on gameplay, creativity, and shipping games fast.

Desired Audience

We want to expand our reach among ambitious creators, aspiring studio founders, and student developers who have the drive to make games and turn their projects into full-fledged indie studios.

Through the Gemu Bootcamp, our developer publishing pipeline, and our Discord-linked Q&A forum, we aim to give these creators the tools, mentorship, and community support needed to master volumetric pixel development and transition from project-building to studio launching. Additionally, we want to attract game investors and licensing partners looking to back these rising indie studios, fund titles created on Gemu, or license our tech.

Case Summary

Our main challenge is transitioning from closed Early Access with select studios to an open request-access model while simultaneously scaling our ecosystem as a game publisher and host of the Gemu Bootcamp.

We need student teams to help to:

1. **Open Request Funnel:** Build a seamless application workflow to attract, evaluate, and onboard indie studios, laid-off veterans, students, and ambitious creators.
2. **Community Infrastructure:** Design a developer Q&A forum linked directly with Discord for scalable support.
3. **Ecosystem Pathways:** Create clear site journeys to drive Gemu Bootcamp enrollment, attract publishing pitches, and connect investors with Gemu-powered games and studios.
